PROFESSIONAL SUMMARY

Senior full-stack engineer & platform lead with 10+ years of experience. Regularly partner with business leadership on technical initiatives and architectural direction. Bridge strategy and execution - set direction across engineering teams and remain hands-on from proof-of-concept to production.

EDUCATION

Indiana University - Kelley School of Business, Indianapolis, IN **2021**
Master of Business Administration, Major in Finance

Purdue University, West Lafayette, IN **2016**
Bachelor of Science, Computer Science

WORK EXPERIENCE

Nike, Beaverton, OR (Remote) **Lead Software Engineer** **2022 - Present**

- Created and lead the technical strategy for the platform powering Nike's retail-store operations (cash management, inventory, metrics, timeclock, and more). Set the path for a standardized stack, shared component library, unified auth + state-management, observability patterns, CI/CD templates, AI-assisted application blueprints, and E2E testing - so multiple engineering teams ship against a shared platform without rebuilding the same layers. Defined contribution standards and migration paths for both new and existing applications.
- Lead web platform engineer for Nike.com. Re-wrote the platform's micro-frontend component for improved runtime performance and maintainability, drove migrations to the latest React, Next.js, and core dependencies, and coordinated cross-team adoption with backwards compatibility throughout.
- Delivered a new unified auth strategy across Nike.com and the Nike iOS app - partnered cross-team with iOS engineers to build a JavaScript bridge so the native app embeds the shared web login portal.
- Shipped an async-chat micro-frontend that drops into every page on Nike.com - one team owns the chat experience; every consumer surface picks it up on deploy. Live on nike.com/help.
- Architected the platform behind every Nike retail page (nike.com/retail/directory and per-store pages like /retail/s/nike-soho)/ Pages are dynamically generated from a headless backend so product owners and store ops can update hours, photos, and services with global propagation in minutes.
- Owned the consumer-facing Store Search micro-frontend on Nike.com from proof-of-concept to production across ~12 teams. Deployed wherever a customer picks a store - from filtering products on /w to selecting a pickup point at /checkout, improving core consumer flows used by millions globally.
- Own Nike.com's Store Locator (nike.com/retail and all child pages), a globally available, high-traffic property with peak days exceeding one million sessions. Led end-to-end migration from Mapbox to Apple Maps in partnership with Apple engineers.

Liberty Mutual Insurance, Indianapolis, IN **Senior Software Engineer** **2020 - 2022**
Software Engineer **2017 - 2019**
Assoc. Software Engineer **2016 - 2017**
IT Analyst **2016**

- Led multiple teams over years to build an internal insurance quoting application from greenfield to production; the platform now handles the full policy lifecycle and generates over \$100K+/day in premiums on average.
- Spearheaded the organization's first Python analytics models, driving investment decisions that led to eliminating legacy technology and establishing a cross-functional methodology aligning actuaries, data scientists, engineers, and stakeholders.
- Created and led a developer upskilling program teaching emerging technologies through hands-on AWS labs; 400+ developers across 60+ teams participated in the multi-organizational event.
- Established code review and release standards for a 3+ year project, streamlining delivery processes for 40+ developers across several teams.
- Architected a unified dashboard and monitoring infrastructure adopted by 20+ teams integrating 500+ applications, enabling on-time decommission of the legacy monitoring vendor.
- Led migration from legacy systems to event-driven cloud architecture, coordinating 20+ developers through design, implementation, and delivery.
- Initiated cross-team community events that senior leadership later adopted as an annual organization-wide engineer skill-building program.
- Maintained and reviewed Java codebases (up to tens of thousands of lines) across teams; planned and executed cloud migrations and decommissioned legacy on-premises systems.

CyberMetrix Inc., Columbus, IN	Software Engineer Intern	2015
- Modernized a legacy Fortran test analysis system to Java, converting several hundred metrics used to test diesel engines.		
SmartTemps LLC., Mishawaka, IN	Software Engineer Intern	2014
- Built a Visual Basic application from scratch to update thermometer firmware, including UI development and low-level network interfaces for custom hardware.		

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Java, Python with early experience in Fortran, C++, C, and more.
Frontend: React, Next.js, Vite, Webpack, Angular, Web APIs, Redux, state management, accessibility, CSS architecture, responsive design, design systems, component libraries.
Testing: Jest, React Testing Library, Playwright, Vitest, JUnit.
Backend & APIs: Spring, Spring Boot, Maven, GraphQL, HATEOAS, REST, Node.js.
Cloud & Delivery: AWS (CloudFront, Route 53, API Gateway, Lambda, S3, DynamoDB, RDS, OpenSearch, SQS, SNS, CDK), Docker, Jenkins, GitHub Actions, blue/green and rolling deployments.
Observability & Security: New Relic, Splunk, CloudWatch, Okta, custom identity providers — proven in high-traffic consumer contexts.

EXTRA

Purdue Polytechnic Highschool	Volunteer	2024 – Present
- Working with high school teachers I support and mentor high school students on semester long projects, teaching them the basics of software development and guiding their career paths.
